

## Digital Velocity Decoder D-VD-0-F

### Ultrafast FPGA-based Digital Signal Processing

Optomet Vibrometers feature an end-to-end FPGA-based digital signal processing allowing a fully digital read-out of the measurement data. Digital signal processing avoids any drawbacks of analog demodulation which may result from component aging, temperature dependencies, noise and non-linearities. Significantly higher sensitivity, better resolution, and stability are the benefits of OptoMET's end-to-end digital signal processing. Extremely low noise levels produce precise results even from poorly reflecting measurement objects.

#### HIGHLIGHTS:

- Digital decoder
- 8 velocity measuring ranges
- Frequency range: 0 Hz - 100 kHz
- Max. velocity up to 2 m/s
- Resolution down to  $6 \text{ nm s}^{-1}/\sqrt{\text{Hz}}$

#### Start Velocity Decoder

All vibrometers series feature by default a velocity decoder and can be supplemented with a suitable displacement and/or acceleration decoder.

The D-VD-0-F velocity decoder is the versatile solution for various types of non-contact vibration metrology tasks. With its 8 velocity measuring ranges, it can measure up to 100 kHz and thus well above the audible acoustic range. Digital signal processing provides excellent linearity and measuring accuracy.
