

Digital Velocity Decoder D-VD-2N

Ultrafast FPGA-based Digital Signal Processing

Optomet Vibrometers feature an end-to-end FPGA-based digital signal processing allowing a fully digital read-out of the measurement data. Digital signal processing avoids any drawbacks of analog demodulation which may result from component aging, temperature dependencies, noise and non-linearities. Significantly higher sensitivity, better resolution, and stability are the benefits of OptoMET's end-to-end digital signal processing. Extremely low noise levels produce precise results even from poorly reflecting measurement objects.

HIGHLIGHTS:

- Digital decoder
- 11 velocity measuring ranges
- Frequency range: 0 Hz - 1 MHz
- Max. velocity up to 5 m/s
- Resolution down to $1.7 \text{ nm s}^{-1}/\text{Hz}$

High-Precision Sense Velocity Decoder

All vibrometers series feature by default a velocity decoder and can be supplemented with a suitable displacement and/or acceleration decoder.

The D-VD-2N velocity decoder has been specially developed to register even the smallest mechanical vibrations and motions. It has 11 velocity measuring ranges from 2.45 mm/s to 5 m/s and is not only ultrasensitive in detecting tiny vibrations up to 1.7 nm/s, but is also ideal for standard vibration measurements in the acoustic and ultrasonic ranges (up to 1 MHz).

* The resolution is defined as the signal amplitude (rms) that produces 0 dB signal/noise ratio with 1 Hz spectral resolution at 50 % f_{max} .
